

VIA FACSIMILE (703) 872-9306

IN THE CLAIMS

This listing of claims will replace all prior versions, and listings, of claims in the application.

Listing of the Claims:

1. (Canceled) An automated rotary microtome blade changing apparatus, comprising
 - (a) an upper stage adapted to releasably engage a supply and a waste cartridge, said upper stage having a loading segment adapted to engage and move blades contained within said supply cartridge into a cutting position;
 - (b) clamping means for releasably holding said blades in place for cutting operations;
 - (c) power means for driving the movement of blades and clamping mechanisms; and
 - (d) electronic control means for integrating all of the functions of the apparatus.
2. (Canceled) An improved blade supply cartridge wherein said cartridge comprises a body, a spring, a dispensing tab, and blades, wherein said improvement comprises a toothed portion on said dispensing tab adapted to engage mating gear teeth on said blade changer.
3. (Canceled) An improved blade supply cartridge wherein said cartridge comprises a body, a spring, a dispensing tab, and blades, wherein said improvement comprises a touch memory device in contact with said cartridge, said touch memory device programmed to contain content information relating to said cartridge.
4. (Canceled) The blade supply cartridge of claim 3 wherein said touch memory device comprises a Dallas Semiconductor DS1985 F5 16 Kbit add-only touch memory device.
5. (Canceled) The blade supply cartridge of claims 2 and 3 wherein the cartridge also has an entrance for accepting spent blades.
6. (Canceled) The blade supply cartridge of claims 2 and 3 wherein the cartridge has exterior alignment slots that engage with guides on the upper stage, thereby enabling precise and reproducible alignment.

VIA FACSIMILE (703) 872-9306

7. (Canceled) The blade supply cartridge of claim 5 wherein said exterior alignment slots position the cartridge in either the supply or waste position on the upper stage.
8. (Canceled) The apparatus of claim 1 wherein said clamping means comprises:
 - (a) a fixed support plate adapted to support a first side of said blade, said fixed support plate in intimate contact with the upper stage body;
 - (b) a clamping plate having a clamping surface capable of engaging a second side of said blade when the clamping plate is pivoted into the clamping position;
 - (c) a pivot means for supporting a midpoint region of said clamping plate, said pivot means itself being integral to or supported by said upper stage;
 - (d) a clamping cam that engages said clamping plate, said clamping cam being mounted on a drive shaft and providing motion orthogonal to drive shaft axis thereby pivoting the clamping plate about said pivot point.
9. (Canceled) The apparatus of claim 1 wherein said power means comprises
 - (a) an electric motor mounted proximate to said drive shaft;
 - (b) a motor pulley mounted between said drive shaft and said electric motor and interconnected therebetween so that power from said motor is transferred to said drive shaft; and
 - (c) a drive shaft for turning said clamping and said loading cams.
10. (Canceled) The apparatus of claim 1 wherein said electronic control means comprises a microcontroller in electrical communication with a switch located on a keypad, a power source, a motor, and a touch memory device located on said cartridges.
11. (Canceled) The apparatus of claim 10 wherein said power source is a DC battery.
12. (Canceled) The apparatus of claim 10 wherein said keypad contains a push-button switch for signaling the microcontroller to move a new blade into position.

VIA FACSIMILE (703) 872-9306

13. (Canceled) The apparatus of claim 10 wherein said safety interlocks comprise solenoid switches mechanically coupled to latches.
14. (Previously amended) An automated rotary microtome blade changing apparatus, comprising
 - (a) an upper stage adapted to releasably engage a supply and a waste cartridge, said upper stage including a loading segment adapted to engage and move blades contained within said supply cartridge into a cutting position;
 - (b) means for releasably clamping means for releasably holding said blades in place for cutting operations, comprising
 - a fixed support plate adapted to support a first side of said blade, said fixed support plate in intimate contact with the upper stage body,
 - a clamping plate having a clamping surface capable of engaging a second side of said blade when the clamping plate is pivoted into the clamping position,
 - a pivot means for supporting a midpoint region of said clamping plate, said pivot means itself being integral to or supported by said upper stage,
 - a clamping cam that engages said clamping plate, said clamping cam being mounted on a drive shaft and providing motion orthogonal to said drive shaft axis thereby pivoting the clamping plate about said pivot point;
 - (c) power means for driving powering the movement of blades and clamping mechanisms, comprising
 - an electric motor mounted proximate to said drive shaft,
 - a motor pulley mounted between said drive shaft and said electric motor and interconnected therebetween so that power from said motor is transferred to said drive shaft; and
 - (d) means for electronically controlling ~~electronic control means for integrating~~ all of the functions of the apparatus, comprising
 - a microcontroller in electrical communication with a switch on a keypad, a power source, a motor, and safety interlocks.

15. (Previously amended) An automated rotary microtome blade changing apparatus, comprising

VIA FACSIMILE (703) 872-9306

- (a) an upper stage adapted to releasably engage a supply and a waste cartridge, said upper stage including a reverser shuttle adapted to engage and move blades contained within said supply cartridge into a cutting position;
- (b) means for releasably clamping means for releasably holding said blades in place for cutting operations, comprising a fixed support plate adapted to support a first side of said blade, said fixed support plate in intimate contact with the upper stage body, a clamping plate having a clamping surface capable of engaging a second side of said blade when the clamping plate is pivoted into the clamping position, a pivot means for supporting a midpoint region of said clamping plate, said pivot means itself being integral to or supported by said upper stage, a clamping cam that engages said clamping plate, said clamping cam being mounted on a drive shaft and providing motion orthogonal to said drive shaft axis thereby pivoting the said clamping plate about said pivot point;
- (c) power means for driving powering the movement of blades and clamping mechanisms, comprising an electric motor adapted to engage said drive shaft, a drive gear mounted on said drive shaft, said drive gear transmitting power to said clamping means and said reverser shuttle; and
- (d) means for electronically controlling electronic control means for integrating all of the functions of the apparatus, comprising a microcontroller in electrical communication with a switch on a keypad, a power source, said motor, and safety interlocks.
